

SORT KUP – INSTALLATION INSTRUCTIONS

Sort Kups are designed to protect hard floors from damage if you are using Sort Füt units under your speakers.

The Sort Kups are machined from the same hard aluminium alloy as the Sort Füt, for perfect energy transfer. Best results will be achieved with the Sort Kups directly coupled to the floor. Optional self-adhesive felt pads are included to protect especially vulnerable surfaces, but these will slightly compromise performance.

Once you have the Sort Kups installed between the Sort Füt units and the floor, you will need to adjust the position of the speakers. Follow the standard instructions, but use two people, one on each side of the speaker (this also works well in a standard Sort Füt installation, especially with larger/heavier speakers). To move the speaker, grip the Sort Füt units and taking a little of the weight, slide the speaker and Sort Kups the desired distance in the desired direction. Be prepared to work in several small shifts if necessary. The Sorts Kups will move easily on all but rough surfaces.

Having moved the speaker, make sure that the Sort Füt units are standing vertically, resting evenly on all their balls, not canted over. The easiest way to do this is to gently rock the speaker and make sure that the Sort Füt units aren't "locked" or dragged sideways. Adjust the position of the Sort Kups if necessary.

Always position the speaker before leveling it and adjusting rake angle.
